CC AAW53114 to AAW5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases consisted with inappropriate expression of polymorphic polypeptides. For cexample, (I) may be used to treat disorders by rectifying mutations or converse in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own converse in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own converse may also be used as NNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and converse which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies may also be used as diagnostic agents for detecting the presence of polymorphic converse and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic converse in amounter agents for detecting the presence of polymorphic converse in amounter agents for detecting the presence of polymorphic converse in amounter agents for detecting the presence of polymorphic converse in amounter agents for detecting the presence of polymorphic converse in amounter agents for detecting the presence of polymorphic converse in amounter agents for detecting the presence of polymorphic converse in a paralles.

```
CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide
CC sequences (I), which contain single nucleotide polymorphisms (SNPs).
CC AAM53114 to AAM53329 represent peptides related to human polymorphic
CC polynucleotide sequences. The sequences can be used in gene and protein
CC therapy, and in vaccine production. (I) and the polypeptides encoded by
CC them may be used in the prevention, diagnosis and treatment of diseases
CC associated with inappropriate expression of polymorphic polypeptides. For
CC deletions in a patient's genome that affect the activity of polypeptides
CC to example, (I) may be used to treat disorders by rectifying mutations or
CC deletions in a patient's genome that affect the patients own
CC production of polypeptide. Additionally, (I) and its complementary
CC sequences may also be used as DNA probes in diagnostic assays to detect
CC antibodies specific for polymorphic polypeptides. The
CC therefore which patients may be used as antigens in the production of
CC polypeptides encoded by (I) may be used as antigens in the production of
CC be used to down regulate expression and activity. The antibodies may also
De used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-NOV-1999; 99US-0168138P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53129 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC by expressing inactive proteins or to supplement the patients own CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC antibodies may be considered as antigens in the production of CC antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic.
                                                                                                                                                                                                                                                                                                                                                 AAI77806
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Shimkets RA,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53124 to AAM53229 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosts and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; single nucleotide polymorphism; SNP; genome; gene ther protein therapy; vaccine; probe; diagnostic assay; detection; quantitation; restorative therapy; polymorphic; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 51 BP; 7 A; 22 C; 9 G; 13 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC sequences (I), which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM5329 represent peptides related to human polymorphic in abmples, and continuous particles encoded by (I) may be used as an attibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymorphic polymorphic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

ABLO0010 to ABL01104 represent human nucleic acid oligonucleotides comprising one or more single nucleotide polymorphisms (SNPs). ABB56531 to ABB56903 represent human peptides encoded by some of the SNP oligonucleotides. The sequences from the present invention can have immunosuppressive, cytostatic, antiinflammatory, neuroprotective and antimicrobial activities. Nucleic acids, polypeptides, oligonucleotides and antibodies from the present invention can be used for treating a subject suffering from, at risk for, or suspected of, suffering from a pathology may be autoimmune diseases, inflammation, cancer, diseases of the nervous system, and infection by pathogenic microorganisms. The SNPs are also useful for determining which forms of a characterised in polymorphism are present in individuals. The antibodies may be used in
                                                                                  the detection, quantitation and/or cellular or tissue localisation of a golymorphic protein (e.g., for use in measuring levels of the polymorphic protein within appropriate physiological samples)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
```

This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA.

the BRCAI

Predicting a predisposition to cancer in a patient comprising detecting deletion in the BRCA1 gene that results from the unequal crossover between a pair of repetitive sequences in the BRCA1 gene.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene, such that the recombined nucleotide sequence containing the deletion indicates a predisposition to breast and ovarian cancer. The present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polynucleotide is a DNA fragment representing a junction sequence that arises as a result of a recombination event in human BRCA1 that causes the omission of exons 15
AAIT3060 to AAIT9867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           30-NOV-1999; 99US-0168138P

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        នន្តន្តន្ត្
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                  comprising one or more single nucleotide polymorphisms (SNPs). ABB56531 to ABB56903 represent human peptides encoded by some of the SNP coligonucleotides. The sequences from the present invention can have antimicrobial activities. Nucleic acids, polypeptides, oligonucleotides and antibodies from the present invention can be used for treating a subject suffering from, at risk for, or suspected of, suffering from a pathology ascribed to the presence of a sequence polymorphism. The pathology may be autoimmune diseases, inflammation, cancer, diseases of the nervous system, and infection by pathogenic microorganisms. The SNPs care also useful for determining which forms of a characterised colymorphism are present in individuals. The antibodies may be used in the detection, quantitation and/or cellular or tissue localisation of a concerning from the conjugation of a characterised colymorphic protein (e.g., for use in measuring levels of the polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human silent noncoding SNP oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ABL00141 standard; DNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ঠ
                                                                                                                CC which contain single nucleotide polymorphisms (SNPs). Sequences 1112 (C (AAA76318 A77429) are consecutive pairs of nucleotides which contain C silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the CC pairs of nucleotides containing SNPs which result in changes in the CC corresponding amino acid sequences (AAB11749-B11828). The SNPs in CC sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino acid CC changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result in non-conservative changes. The SNPs in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also CC relates to a method of detecting a polymorphic site in a nucleic acid and CC against such peptides containing polymorphic sites, antibodies raised CC groteins/peptides, and a method of detecting polymorphic CC gene therapy of an individual having, suspected of having, or at risk of CC developing a pathological condition due to the presence of a sequence CC polymorphism. Such treatment would comprise administration of the wild-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                     changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result in non- conservative changes. The SNPs in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of detecting polymorphic sites, antibodies raised against such peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic proteins/peptides using the antibodies. The mucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence polymorphism. Such treatment would comprise administration of the wildtype nucleic acid sequence. Antibodies raised against polymorphic peptides can also be used in the treatment of such individuals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 (AAA76318-A77429) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AABA1749-B11828). The SNPs in sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; single gene therapy;

by pathogenic

microorganisms.

useful in the development of compounds with cytostatic, useful in the development of compounds with cytostatic, immunosuppressive, antiinflammatory, neuroprotective or antimicrobial activities. Regulators of metabolic pathways such as fatty acid metabolism, glycolysis, and amino acid metabolism may also be developed. The compounds may be useful for treating a subject suffering from or at risk for a pathology associated with the presence of a sequence polymorphism. SNP detection is also useful in paternity analysis and forensic application. Polymorphisms may contribute to the phenotype of an organism and phenotypic traits include genetic diseases such as autoimmune diseases, cancer, diseases of the nervous system and infection

Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism.

Claim 1; Page 370; 543pp; English.

Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 (AAA76318-A77429) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides which contain corresponding amino acid sequences (AAB11749-B11828). The SNPs in sequences 113 to 1128 (AAA77430-A77445) lead to conservative amino acid changes, while those in sequences (AAB11749-B11828). The SNPs in sequences 113 to 1128 (AAA77430-A77445) lead to conservative amino acid changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result in non- conservative changes. The SNPs in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of determining the relatedness of two nucleic acids. It also a method of determining the relatedness of two nucleic acids. It also encompasses peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic proteins/peptides using the antibodies. The nucleic acids are useful for gene therapy of an individual having, suspected of having, or at risk of developing a pathological condition due to the presence of a sequence polymorphism. Such treatment would comprise administration of the wild-Type nucleic acid sequence. Antibodies raised peptides can also be used in the treatment of against such ind individuals

Single nucleotide polymorphisms (SNPs) tend to occur with great frequency throughout the genome and may be located close to loci of interest. Such variations can cause or be closely linked to pathological conditions (genetic diseases). Hence the SNPs of the invention may be This invention relates to novel isolated nucleotide sequences which comprise 217 defined polymorphic sequences. Sequence polymorphism-based analysis of nucleic acid sequences can augment or replace previously known methods for determining the identity and relatedness of Novel polynucleotide and polypeptide including one or more single nucleotide polymorphisms, useful for diagnosing and treating condit associated with the presence of sequence polymorphism in humans and Human single nucleotide polymorphism (SNP) region Seq ID32 18-DEC-2003 ADC16930; ADC16930 17-NOV-1999; WO200029622-A2 Homo sapiens fatty acid metabolism; glycolysis; amino acid metabolism;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SXS
                                                                                                                                                                         CC polynucleotide sequences. The sequences can be used in gene and protein CC them may be used in the provention. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides or production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides specific for polymorphic polypeptides. The antibodies may also be used as diagnostic assents of complementary also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymo

                                                                                                                                                                                                                                                            CC sequences (I), which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM53329 represent peptides related to human polymorphic polymorphic in the polymorphisms (SNPs).

CC polynucleotide sequences. The sequences can be used in gene and protein continuous the invaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases consisted with inappropriate expression of polypeptides. For continuous in a patient's genome that affect the activity of polypeptides or conduction in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own conduction of polypeptide. Additionally, (I) and its complementary considered as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and considered which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of bused to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic conclusions.
                                                                      Matches

                                                                                                                  밁
                                                                                                                                              á
                                                                                                                                                                                                                                                                            CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53129 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC by expressing inactive proteins or to supplement the patients own CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides.
                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                    CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM33114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC polypeptides encoded by (I) may be used as antigens in the production of CC polypeptides specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic be used as diagnostic agents for detecting the presence of polymorphic colypeptides may also be used as diagnostic agents for detecting the presence of polymorphic CC polypeptides in samples

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             therapy, and in vaccine production. (1) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (1) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (1) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (1) may be used as antigens in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein therapy; vaccine; probe; diagnostic assay; detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC AAI73366 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by the may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of CC polypeptides expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic constraints of polymorphic agents for detecting the presence of polymorphic antibodies may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

For cc by expressing inactive proteins or to supplement the patients own cc production of polypeptide. Additionally, (I) and its complementary cc sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The cc polypeptides encoded by (I) may be used as antigens in the production of complements as a patient of complements of complements of cantibodies may also be used as diagnostic aspents for detecting the presence of polypeptides may also be used as diagnostic agents for detecting the presence of polymorphic

AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

CC AAM53114 to AAM5329 represent peptides related to human polymorphic contain single nucleotide polymorphisms (SNPs).

CC polynucleotide sequences. The sequences can be used in gene and protein contempy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases cassociated with inappropriate expression of polymorphic polypeptides. For caxemple, (I) may be used to treat disorders by rectifying mutations or caxemple, (I) may be used to treat disorders by rectifying mutations or caxemple, (I) may be used to treat disorders by rectifying mutations or compression of polypeptides. Additionally, (I) and its complementary confidences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and confidence therefore which patients may be in need of restorative therapy. The contibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagnostic agents for detecting the presence of polymorphic colleges may also be used as diagn
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1;

```
CC sequences (I), which contain single nucleotide polymorphic polynucleotide CR sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53329 represent peptides related to human polymorphic CR cambility, and in vaccine production. (I) and the polypeptides encoded by therapy, and in vaccine production. (I) and the polypeptides encoded by the may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC deletions in a patient's genome that affect the activity of polypeptides or CC deletions in a patient's genome that affect the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect CC and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC continuous production of polypeptides encoded by (I) may be used as antigens in the production of CC polypeptides encoded by (I) may be used as antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). AAM53114 to AAM53129 represent peptides related to human polymorphic polymucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polyportides.

CC G
CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAA5329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by CC them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC example, (I) may be used to treat disorders by rectifying mutations or CC eletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be in need of restorative therapy. The CC antibodies specific for polymorphic polypeptides. The antibodies may also be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The polypeptides encoded by (1) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 51 BP; 12 A; 8 C; 23 G; 8 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Homo sapiens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              quantitation;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            믕
                                                   continuous control of the polymenton of the polymenton of the polymenton of diseases content may be used in the prevention, diagnosis and treatment of diseases cassociated with inappropriate expression of polymorphic polymeptides. For cexample, (I) may be used to treat disorders by rectifying mutations or cexample, (I) may be used to treat disorders by rectifying mutations or complete the activity of polymeptides on the prevention of polymeptides on the production of polymeptides or to supplement the patients own composition of polymeptides or production of polymeptides. Additionally, (I) and its complementary completed the presence of similar nucleic acids in samples, and confident the production of contibodies may also be used as antigens in the production of colymeptides encoded by (I) may be used as antigens in the production of contibodies specific for polymorphic polymeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colymeptides in samples
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                              AAI73060 to AAI79867 represent isolated human polymorphic polymucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

C AAM53114 to AAM5329 represent peptides related to human polymorphic polypeptides. For certain may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For certain polymorphic polypeptides. For certain complex polypeptides for certain polymorphic polypeptides for certain polymorphic polypeptides. For certain polymorphic polypeptides or complement the patients own certain polymorphic polypeptides or complement the patients own certain polymorphic poly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 136

                                                                                                                                                                     CC AANT3166 to AANT9867 represent isolated human polymorphic polynucleotide CC sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by C them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC example, (I) may be used to treat ffect the activity of polypeptides or CC by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC polypeptides encoded by (I) may be used as antigens in the production of contibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colypeptides in samples in samples.

                                                                                                                                                                                                                                                                                                                               Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide contents of the polynorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases composed the production of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or completions in a patient's genome that affect the activity of polypeptides for production of polypeptide. Additionally, (I) and its complementary composed by expressing inactive proteins or to supplement the patients own composed by the patients of the sequences may also be used as DNA probbes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and complements the production of polypeptides may be in need of restorative therapy. The complement of complements of the polypeptides of the production of complements may be used as antigens in the production of complements

```
CC polynciectide sequences. The sequences can be used in gene and protein content may be used in the prevention, (i) and the polypeptides encoded by caseociated with inappropriate expression of polymorphic polypeptides. For content can be used to treat disorders by rectifying mutations or content in a patient's genome that affect the activity of polypeptides. For conduction of polypeptide. Additionally, (i) and its complementary confidences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be used as antigens in the production of polypeptides. For confidence specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of similar nucleic acids in samples, and contibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC AAM53114 to AAM53329 represent peptides related to human polymorphic CC polymucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC therefore which patients may be used as antigens in the production of polypeptides encoded by (I) may be used as antigens in the production of contibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences (I), which contain single nuclectide polymorphisms (SNPs).

AAM53314 to AAM53329 represent peptides related to human polymorphic polymorphic polymorphic polymorphic polymorphic polymorphic polymorphic states and the sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polymorphic polymorphic consociated with inappropriate expression of polymorphic po
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
```

```
cc pairs of nucleotides containing SNPs which result in changes in the corresponding amino acid sequences (AAG64751-AAG64762). The SNPs in cc corresponding amino acid sequences (AAG64751-AAG64762). The SNPs in cc sequences 574 (AAH90699-AAH90694) lead to conservative amino acid cc changes, while those in sequences 575 to 578 (AAH90695-AAH90698) result cr non-conservative changes. The SNP in sequences 579 and 580 (AAH90699-AAH90700) generates a frameshift mutation. The invention also relates to call a method of detercting a polymorphic site in a nucleic acid and a method cc of determining the relatedness of two nucleic acids. It also encompasses peptides containing polymorphic sites, antibodies raised against such competities, and a method of detecting polymorphic proteins/ peptides using the antibodies. The nucleic acids are useful for gene therapy of an conditional having, suspected of having, or at risk of developing a condition due to the presence of a sequence polymorphism. Such treatment would comprise administration of the wild-type nucleic acid sequence. Antibodies raised against polymorphic peptides can also be considered as a sequence polymorphism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences AAH90121-AAH90168 polymorphisms (SNPs). Sequences 1 to 568 contain single nucleotide polymorphisms of nucleotides which contain (AAH90121-AAH90688) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 569 to 580 (AAH90689-AAH90700) are consecutive silent SNPs. Sequences 569 to 580 (AAH90689-AAH90700) are consecutive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences AAH90121-AAH90700 represent 580 human cDNA sequences contain single nucleotide polymorphisms (SNPs).           The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, menningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male inferrility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesteroleemia, obesity or autoimmunity. The present sequence is a polymorphism-containing
                                                                                                                                                                                                                                                           Isolated human polynucleotides contain: polymorphisms, useful for the treatment infection and diabetes.
                                                                                                                                                                                                                                                                                                                                   WPI; 2001-451871/48.

                                                                                                                                   The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytiopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, codema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human coding sequence polymorphic site SEQ ID NO: 300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-OCT-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 189; 475pp; English.

The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabettes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, neurological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolæmia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer amplifications of the containing single paternal protein expression, including cancer amplifications.
                                                                                                                                                                   Claim 1;
                                                                                                                                                                                                                Isolated human polynucleotides containing single nucleotide polymorphisms, useful for the treatment and diagnosis of e.g. cancer,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match
                                                                                                                                                              This invention relates to a novel isolated protein which comprises a human mannosyl transferase having the same sequence as the fully define 611- or 255-amino acid sequence or its fragment. The invention may be useful for the production of compounds with an antimanic or antidepressant activity whilst the disclosed sequences may be used for gene therapy. The invention also provides a human mannosyl transferase fusion protein and a chromosome 9 fusion protein, both of which result from a chromosome 11 translocation. The human mannosyl transferase and the fusion proteins are useful for diagnosing or predicting the susceptibility to a bipolar disorder and for identifying a compound that of a region of human DNA surrounding a single nucleotide polymorphism within the gene which encodes the human mannosyl transferase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention % \left\{ 1\right\} =\left\{ 1\right\} =
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide comprising human mannosyl transferase, useful for diagnosing or predicting the susceptibility to a bipolar disorder identifying a compound that modulates the activity of a mannosyl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human; mannosyl transferase; antimanic; antidepressant; gefusion protein; chromosome 9 fusion protein; chromosome 11 bipolar disorder; single nucleotide polymorphism; SNP; ds.

                                                                                                                                                           AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide consequences (I), which contain single nucleotide polymorphisms (SNPs). CC AAM53114 to AAM5329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein cc therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases cc associated with inappropriate expression of polymorphic polypeptides. For cc example, (I) may be used to treat disorders by rectifying mutations or cc example, (I) may be used to treat disorders by rectifying mutations or cc productions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own cc production of polypeptide. Additionally, (I) and its complementary csequences may also be used as May probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and ctherefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of complementary complements of the used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colleges in camples.

                                                                                                                                                                                                                                                                                                                          present invention describes newly discovered deletion mutations that are believed to be deleterious and cause significant alterations in the structure or biochemical function of BRCA1. Accordingly, it provides methods for detecting such mutants, as well as identifying and screening for cytostatic compounds useful for treating or preventing cancers associated with a BRCA1 genetic variant. This polymucleotide is a mutant human BRCA1 genomic DNA fragment that arises as a result of a recombination event (deletion 1), which causes the omission of exons 16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to a novel method for predicting a predisposition to cancer in a patient by detecting large deletions in the human tumour suppressor gene identified as the breast cancer susceptibility gene 1 (BRCA1). Specifically, it refers to deletions that result from the unequal crossover between a pair of repetitive Alu sequences in the BRCA1 gene, such that the recombined nucleotide sequence containing the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Predicting a predisposition to cancer in a patient comprising detecting deletion in the BRCA1 gene that results from the unequal crossover between a pair of repetitive sequences in the BRCA1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 07-JUN-2002; 2002US-0387132P

                                                                                                                                                                                                                                                                                გ
                                                                                                                                                                                                                                                                                                                                                                                                                      AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNP8). CC AAM53124 represent peptides related to human polymorphic polymorphic cc polynucleotide sequences. The sequences can be used in gene and protein cc therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases cc associated with inappropriate expression of polymorphic polypeptides. For cc example, (I) may be used to treat disorders by rectifying mutations or cc example, (I) may be used to treat affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own cc production of polypeptide. Additionally, (I) and its complementary cc sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and ct therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polypeptides in samples.
                                                                                                                                                                                                                                                                                                                                                     Query Match

(I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, (I) and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by (I) may be used as antigens in the production of antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic polymo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAI73060 to AAI79867 represent isolated human polymorphic polynucleotide sequences (I), which contain single nucleotide polymorphisms (SNPs).

AAM53114 to AAM53329 represent peptides related to human polymorphic polynucleotide sequences. The sequences can be used in gene and protein therapy, and in vaccine production. (I) and the polypeptides encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          protein therapy; vaccine; probe; diagnostic assay; detection;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC AAMS3114 to AAMS329 represent peptides related to human polymorphic CC polynucleotide sequences. The sequences can be used in gene and protein CC therapy, and in vaccine production. (I) and the polymorphic may be used in the prevention, diagnosts and treatment of diseases CC associated with inappropriate expression of polymorphic polypeptides. For CC example, (I) may be used to treat disorders by rectifying mutations or CC deletions in a patient's genome that affect the activity of polypeptides by expressing inactive proteins or to supplement the patients own CC production of polypeptide. Additionally, (I) and its complementary CC sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and CC untibodies may be in need of restorative therapy. The CC antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic colymorphic acids as a diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                     The present invention relates to human nucleic acids containing single nucleotide polymorphisms (SNPs). These can be used in forensic and paternity tests, and to aid in the treatment of diseases associated with aberrant protein expression, including cancer, amyloidosis, diabetes, Alzheimer's disease, Down's syndrome, oedema, lupus (SLE), vasculitis, glomerulonephritis, haemolytic anaemia, thrombocytopaenia, arthritis, meningitis, muscular disorders, dementia, nerrological diseases, tuberous sclerosis, male infertility, hypercalcaemia, blood pressure disorders, osteoporosis, pathogenic infections, hypercholesterolaemia, obesity or autoimmunity. The present sequence is a polymorphism-containing oligonucleotide fragment of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; Page 189; 475pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC SNP flanking sequence, the SNPE primer is used as a genotyping primer.

CC The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The genotyping primer is used as a genotyping primer.

CC oligonucleotides are useful for determining the presence, absence or component to a sample of the genotyping nucleic acid samples, for e.g. to component to a sample of an individual or group of component to the genotypic traits suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. component, diabetes insipidus, Lesch-Nyhan syndrome, muscular complex for susceptibility to multifactorial component is or may be genetic stickidney disease, confilated symptoms of or susceptibility to multifactorial confilammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and component sequence represents a fragment of human component 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a
                  New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nuc
                                                                                                                                                                                                                                                                                                      13-OCT-2000; 2000WO-US028436.

Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking controlled includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC oligonucleotides of the invention. The PCR primers are used to amplify a CC oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid sample by clidantity of a SNP and for genotyping nucleic acid samples, for e.g. to casess by association analysis the genotype of an individual or group of clidatividuals, having a pathological phenotypic traits suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. cagammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cc dystrophy, familial hypercholesterolaemia, polycystic kidney disease, steegenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cd disease of which a component is or may be genetic such as autoimmune cliseases, including, rheumatoid arthritis, multiple sclerosis, includes and include also useful in forensic investigations and conternity analysis. The present sequence represents a fragment of human content the airs of a sincle relation of human of the mineral content as a content of human of the present sequence represents a fragment of human content the airs of a sincle relation of the mineral content of the present sequence represents.
                                                                                                                                                                           Sequence 51

The pathology may be autoimmune diseases, inflammation, cancer, diseases of the nervous system, and infection by pathogenic microorganisms. The SNPs are also useful for determining which forms of a characterised polymorphism are present in individuals. The antibodies may be used in the detection, quantitation and/or cellular or tissue localisation of a polymorphic protein (e.g., for use in measuring levels of the polymorphic protein within appropriate physiological samples)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              comprising one or more single nucleotide polymorphisms (SNPs). ABB56 to ABB56903 represent human peptides encoded by some of the SNP oligonucleotides. The sequences from the present invention can have
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunosuppressive, cytostatic, antiinflammatory, neuroprotective and antimicrobial activities.
